

Reliable Next-Day SET Index Forecasting Requires More Than a Winning Model

A point-in-time audit of numerical denoising, predicted news, LLM inference, regime-aware XAI and transfer

INPUT

market, news and frozen models

Dated financial news

2018-2025 | out-of-sample sentiment

FIVE FROZEN ARCHITECTURES

LSTM | CNN | LSTM-CNN

LSTM-Attention | LSTM-CNN-Attention

Target: next-session Up / Down

METHOD

five reliability dimensions

01

Point-in-time design

Expanding windows; train-only transforms

02

Causal VMD ablation

Full-TA versus Full-TA + rolling VMD

03

Multimodal and LLM

OOS news; Bull LLM + Bear LLM -> Leader (intrinsic)

04

Regime-aware XAI

Bull/Sideway/Bear; train-only SHAP; LIME check

05

Forward and transfer

Partial-2026 stress; frozen SET100

Matched cohorts | controls | Holm adjustment | frozen transfer

OUTPUT

paired evidence and failure modes

962 held-out sessions

2022-2025 | five fixed seeds

VMD: -0.60 to +0.35 pp

No conclusive directional effect

News: no robust BAcc gain

Leader: +5.93 to +6.00 pp (intrinsic only)

Regime-SHAP: CNN +1.46 pp

Mixed elsewhere | LIME low fidelity 71.83%

Forward shift revealed failure modes

2026 one-sided collapse | SET100 weaker 5/5

No primary forecasting BAcc contrast passed Holm

TAKE-HOME MESSAGE

Effects were architecture-specific; no primary forecasting balanced-accuracy contrast survived the registered temporal, falsification, multiplicity and transfer checks.
